## **Abstract**

This report explains our approaches to solving the problems of the practical assignment 2, the experiments we performed, the results and conclusion of our work. The code we developed is uploaded to our Github repository [1].

In this assignment we implement and train sequential language models on the Penn Treebank dataset. Problem1-3 include the implementation of a simple vanilla RNN, an RNN with a gating mechanism(GRU) and a transformer network, respectively

## **1 Problem 1: Implementing a Simple RNN**

The implementation of a Simple Recurrent Neural Network can be found in the models.py script. To train the model you need to execute the script ptb-ml.py.

## **2 Problem 2: Implementing an RNN with Gated Recurrent Units (GRU)**

The implementation of an RNN with a gating mechanism (GRU) can be found in the models.py script. To train the model you need to execute the script ptb-ml.py.

## **3 Problem 3: Implementing the attention module of a transformer network**

The implementation of the attention module of a transformer network can be found in the models.py script. To train the model you need to execute the script ptb-ml.py.

## **4 Training language models**

### **4.1 Model Comparison**

In this section we will present the result of the first experiment of the 3 models the vanilla RNN, GRU, and Transformer, with their correspondant hyperparameters shown in Table 1. All the models are run for 40 epochs.

Hyperparameters	Vanilla RNN	GRU	Transformer
Optimizer	ADAM	SGD_LR_SCHEDULE	SGD_LR_SCHEDULE
Learning rate	0.0001	10	20
Batch size	20	20	128
Sequence length	35	35	35
Hidden size	1500	1500	512
Number of layers	2	2	6
Dropout probability	0.35	0.35	0.9

Table 1: Model’s settings

Table 2 shows the results of this first experiment. We notice that the Transformer is the best model in terms of time-processing and validation/training loss. The GRU is the most expensive model in term of time processing but gives a better result than the vanilla RNN. The latter is the worst in term of training and validation loss.

Result	Vanilla RNN	RNN with GRU	Transformer
Training PPL	120.97	65.85	63.01
Validation PPL	157.82	102.63	147.11
Time processing per epoch (s)	411	668	163

Table 2: First experiment results

The perplexity results are the same for RNN and GRU. For the for Transformer we got a result close to what was expected:

- RNN: train: 120 val: 157
- GRU: train: 65 val: 104
- TRANSFORMER: train(expected): 67 val: 146

This proves that our models are well implemented. The different values in the case of Transformer can be explained by the fact that the transformer is sensitive to initialization and implementation of the code.

Lastly, the Figures below show the learning curves for (train and validation) PPL per epoch and per wall-clock-time, for the architectures above:

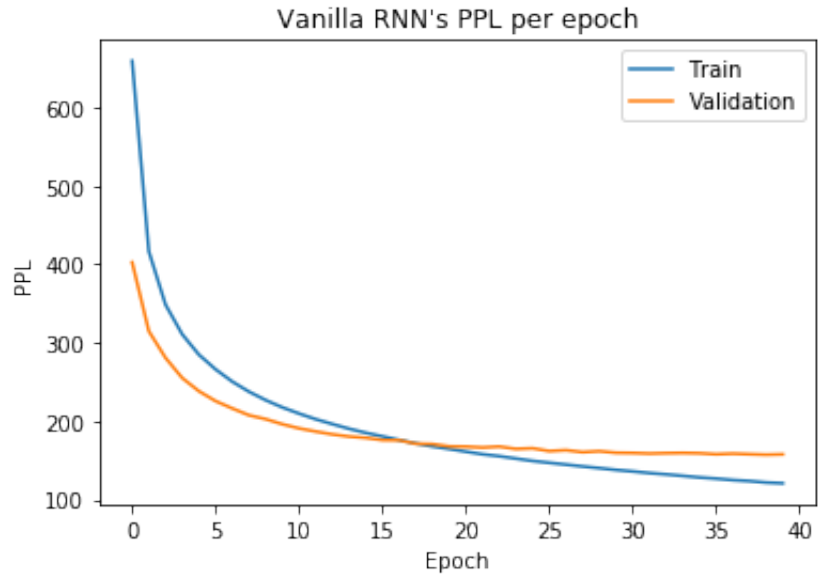

Figure 1: Vanilla RNN's PPL per epoch

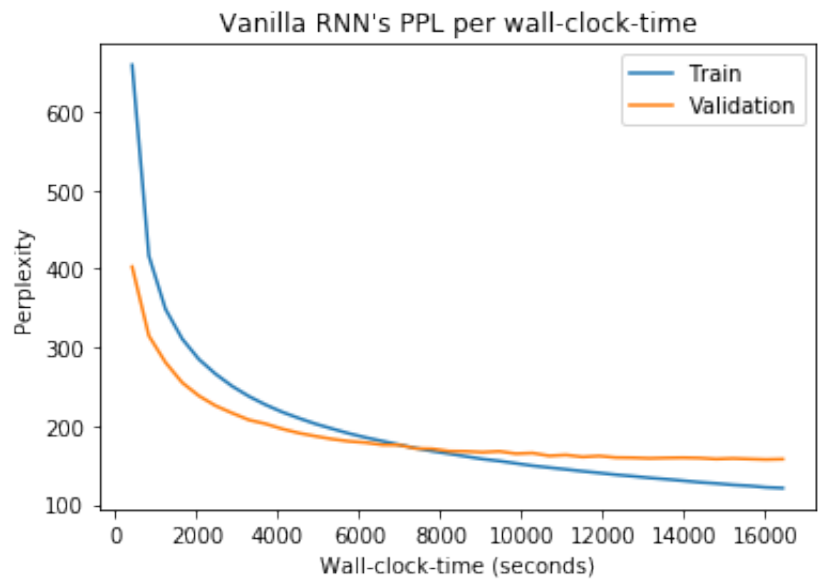

Figure 2: Vanilla RNN's PPL per wall-clock-time

Figure 3: GRU PPL per epoch

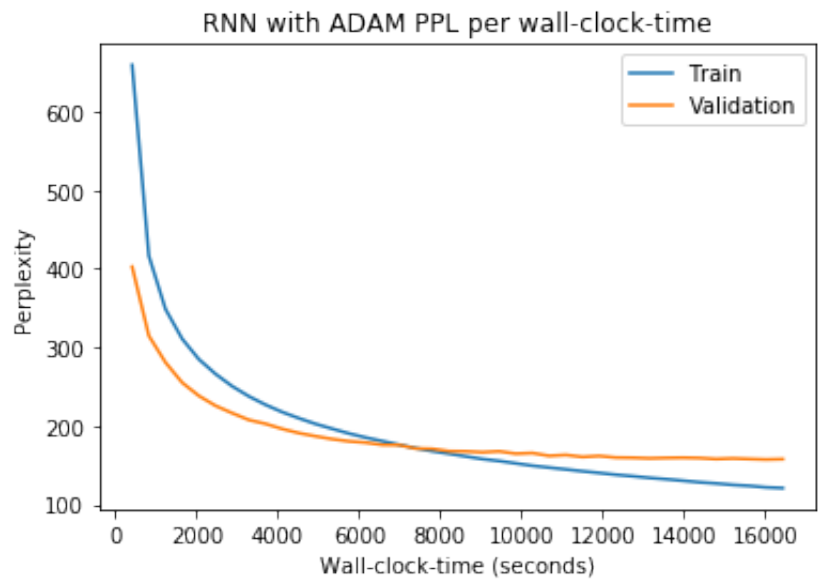

Figure 4: GRU PPL per wall-clock-time

Figure 5: Transformer PPL per epoch

Figure 6: Transformer PPL per wall-clock-time

## 4.2 Exploration of optimizers

In this section we will explore different optimizers for each of the previous models. Each model is run with two different optimizers with the hyperparameters as given in the assignment.

- 1) **Results for Vanilla RNN:** The hyperparameters used for experiments 2 and 3 are given in the Table 3.

Hyperparameters	Experiment 1	Experiment 2	Experiment 3
Optimizer	ADAM	SGD	SGD_LR_SCHEDULE
Learning rate	0.0001	0.0001	1
Batch size	20	20	20
Sequence length	35	35	35
Hidden size	1500	1500	512
Number of layers	2	2	2
Dropout probability	0.35	0.35	0.35

Table 3: Vanilla RNN additionnal experiments' hyperparameters

The results of these experiments are shown in Table 4. We notice that SGD performed worst and could not converge within 40 epochs, whereas ADAM performs best for the same number of epochs and the same hyperparameters. Additionnaly, the SGD\_LR\_SCHEDULE works better than SGD for a bigger learning rate and lower model capacity. In terms of training time, experiment 1 was the slowest, experiment 3 was the fastest while experiment 2 showed an average performance. Given the above setting with the hyperparameters as shown in Table 3, we conclude that the first experiment (ADAM) is best in terms of performance on the validation set.

Result	Experiment 1	Experiment 2	Experiment 3
Training PPL	120.97	3008.63	229.56
Validation PPL	157.82	2220.49	195.67
Average time processing per epoch (s)	411	384	185

Table 4: Vanilla RNN results experiments

Figure 8: Experiment 2 of RNN with SGD optimizer, learning curve by time-clock

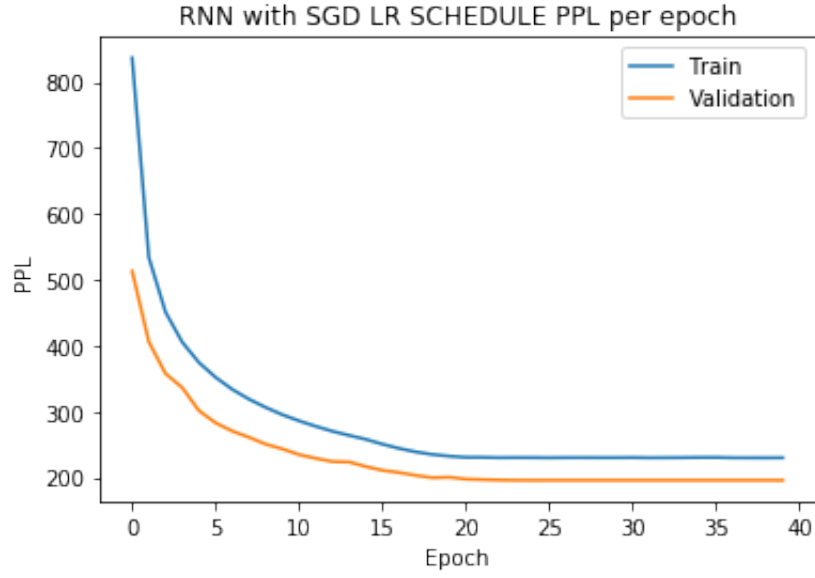

Figure 9: Experiment 3 of RNN with SGD decay optimizer, learning curve by epoch

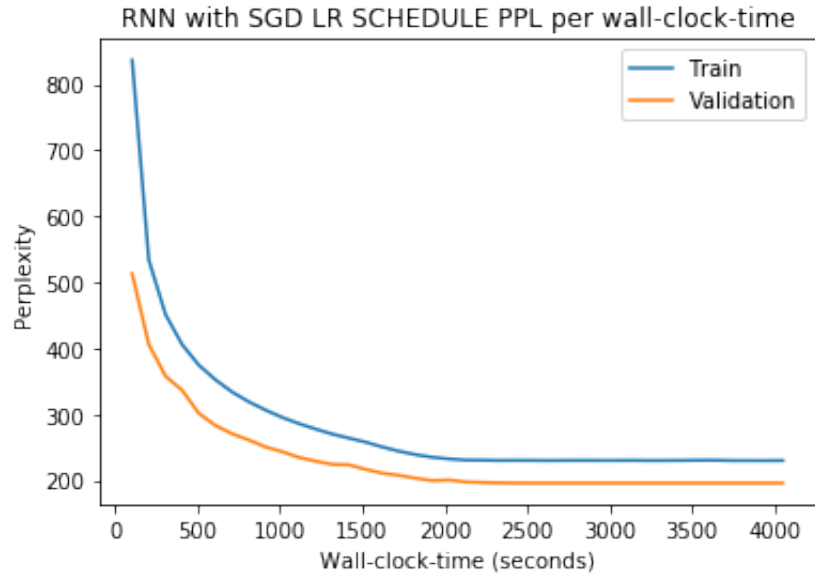

Figure 10: Experiment 3 of RNN with SGD decay optimizer, learning curve by time-clock

- 2) **Results for GRU:** In the experiments 2 and 3, for GRU, we used the parameters given in Table 5.

Hyperparameters	Experiment 1	Experiment 2	Experiment 3
Optimizer	SGD_LR_SCHEDULE	SGD	ADAM
Learning rate	10	10	0.0001
Batch size	20	20	20
Sequence length	35	35	35
Hidden size	1500	1500	1500
Number of layers	2	2	2
Dropout probability	0.35	0.35	0.35

Table 5: RNN with GRU additional experiments' hyperparameters

The results are shown in Table 6. We notice that SGD\_LR\_SCHEDULE performed best on the validation set, which indicates that it might also generalize well. With a larger learning rate, SGD performed better than on the Vanilla RNN. ADAM's performance on the training set was best, but its variance was greater than SGD\_LR\_SCHEDULE, which may indicate that the model starts to overfit.

Result	Experiment 1	Experiment 2	Experiment 3
Training PPL	65.85	50.33	59.98
Validation PPL	102.63	121.36	113.71
Average time processing per epoch (s)	668	648	675

Table 6: First experiment results

Figure 12: Experiment 2 of GRU with ADAM optimizer, learning curve by time-clock

Figure 13: Experiment 3 of GRU with SGD optimizer, learning curve by epoch

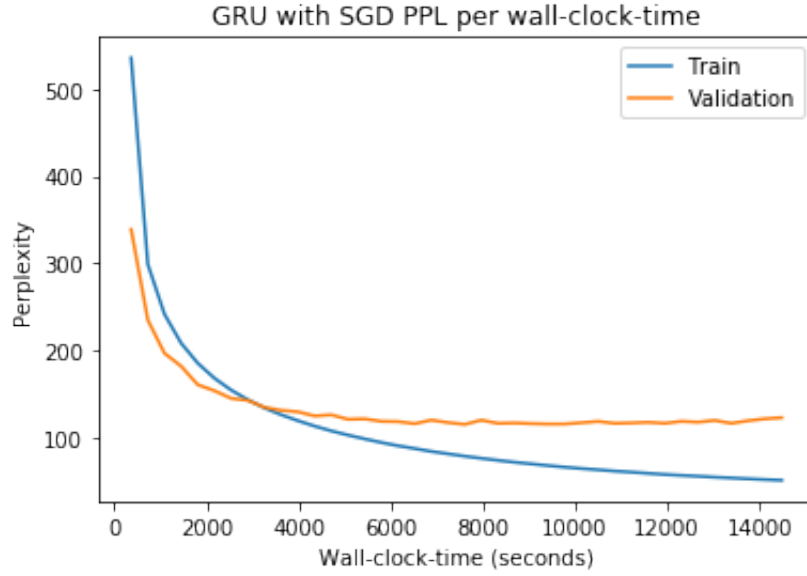

Figure 14: Experiment 3 of GRU with SGD optimizer, learning curve by time-clock

3) **Results for Transformer:** The following parameters were used:

Hyperparameters	Experiment 1	Experiment 2	Experiment 3
Optimizer	SGD_LR_SCHEDULE	SGD	ADAM
Learning rate	20	20	0.001
Batch size	128	128	128
Sequence length	35	35	35
Hidden size	512	512	512
Number of layers	6	6	2
Dropout probability	0.9	0.9	0.9

Table 7: The hyperparameters for additional Transformer experiments

The following are the results for the transformer:

Result	Experiment 1	Experiment 2	Experiment 3
Training PPL	63.01	50.21	33.88
Validation PPL	147.11	126.07	163.91
Average time processing per epoch (s)	163	176	164

Table 8: First experiment results

### 4.3 Exploration of hyperparameters

In this section we will present the result of the validation processus which consist on finding the best hyperparameters per architecture and per optimizer. This operation has required more than 30 experiments, from chich we will take the best 3 per architecture, which is 6 in total. The

Figure ?? present the result of these experiments:

Model	Optimizer	Train ppl	Valid ppl	Time per epoch	Experiment
RNN	ADAM	119,95	<b>142,54</b>	124	experiment 5
RNN	ADAM	104,51	141,38	157	experiment 4
RNN	SGD_LR_SCHEDULE	140,46	145,49	150	experiment 6
GRU	ADAM	71,09	109,9	213	experiment 6
GRU	SGD_LR_SCHEDULE	61,79	<b>102,23</b>	292	experiment 4
GRU	SGD_LR_SCHEDULE	66,92	102,99	266	experiment 5
Transformer	ADAM	5.0816	<b>124.266</b>	96	experiment 4
Transformer	ADAM	4.64649	125.287	137	experiment 5
Transformer	ADAM	50.21	126.07	176	experiment 6

Figure 19: Summary of the best experimentation of the 3 models

In the following table we will show all the hyperparameters values that we used for those experiments:

Model	Experiment	Learning rate	Batch size	Hidden size	Number of layers	Dropout probability
RNN	experiment 5	0.0001	32	512	2	0.50
RNN	experiment 4	0.0001	32	640	3	0.55
RNN	experiment 6	3	32	768	2	0.50
GRU	experiment 6	0.0004	32	640	2	0.35
GRU	experiment 4	12	32	1024	2	0.40
GRU	experiment 5	11	32	896	2	0.40
Transformer	experiment 4	0.0001	128	1024	6	0.9
Transformer	experiment 5	0.0001	128	1024	9	0.9
Transformer	experiment 6	0.0001	128	512	6	0.7

Figure 20: Summary of the hyperparameters used in the experimentation above

We will show next the learning curves of each experiment:

- Vanilla RNN:

Figure 21: Experiment 4: Best result for RNN which gets better result than the baseline (learning curve by epoch)

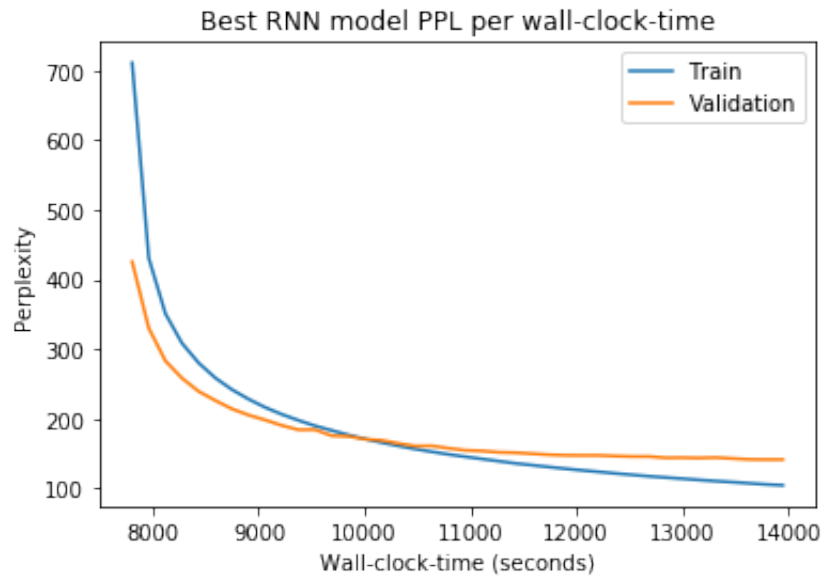

Figure 22: Experiment 4: Best result for RNN which gets better result than the baseline (learning curve by time-clock)

Figure 23: Experiment 5: 2nd best result for RNN (learning curve by epoch)

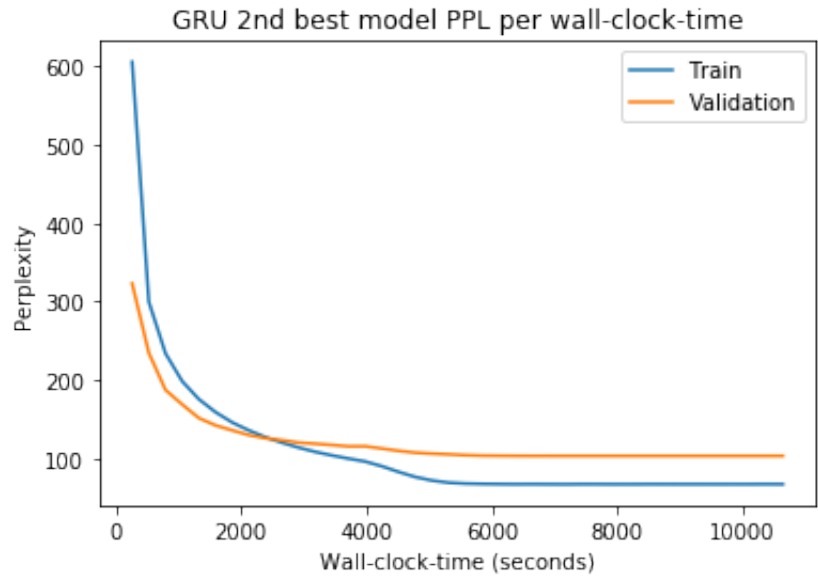

Figure 30: Experiment 5: 2nd best result for GRU (learning curve by time-clock)

Figure 31: Experiment 6: 3rd best result for GRU (learning curves per epoch)

Figure 32: Experiment 6: 3rd best result for GRU (learning curves per clock)

- Transformer:

Figure 33: Experiment 4: Best result for Transformer which gets better result than the baseline (learning curve by epoch)

Figure 34: Experiment 4: Best result for Transformer which gets better result than the baseline (learning curve by time-clock)

Figure 35: Experiment 5: 2nd best result for Transformer (learning curve by epoch)

Figure 36: Experiment 5: 2nd best result for Transformer (learning curve by time-clock)

Figure 37: Experiment 6: 3rd best result for Transformer (learning curves per epoch)

Figure 38: Experiment 6: 3rd best result for Transformer (learning curves per clock)

4. Make 2 plots for each optimizer; one which has all of the validation curves for that optimizer over epochs and one over wall-clock-time.
5. Make 2 plots for each architecture; one which has all of the validation curves for that architecture over epochs and one over wall-clock-time.

## 4.4 Discussion

1. What did you expect to see in these experiments, and what actually happens? Why do you think that happens?

We expected that the GRU will get better performance than the vanilla RNN, which was the case. In terms of time processing we have expected that GRU will be slower than the other architecture which was the case either given his number of calculations.

In other hand, we expected the Transformer will outperform the other architectures in terms of perplexity on the validation set and in terms of time processing. It was the case for the time processing but, it wasn't the best model in all cases.

In terms of optimizer, we expected that ADAM will get better result, but SGD with learning rate decay was better optimizer.

2. Referring to the learning curves, qualitatively discuss the differences between the three optimizers in terms of training time, generalization performance, which architecture they're best for, relationship to other hyperparameters, etc.

Assuming that the comparison here was made with a set of hyperparameters that give a fair baseline for all the models, we can say that there is no universal best optimizer regardless of the model architecture. In fact, each model architecture works better with a suited optimizer. However, we notice that ADAM is a very powerful optimizer that can make the model converge very quickly. However, if not well-tuned it could make the model overfit the training data.

3. Which hyperparameters+optimizer would you use if you were most concerned with wallclock time? With generalization performance? In each case, what is the "cost" of the good performance (e.g. does better wall-clock time to a decent loss mean worse general loss? Does better generalization performance mean longer training time?)

If we are more concerned with the time processing we would use Transformer which is clearly very fast than the other architecture. And the cost of good performance for this kind of architecture is to have a lot of data and a very good tuning using regularization. If we are more concerned with generalization, we would use GRU as it seems to be less sensitive to overfitting better than Transformer as shown in Figure 33. In this case, the cost of a good performance is the time processing as GRU takes more time train and it is hard to get good hyperparameters.

Training a model for a long time does not mean better performance, because the model will be either in a stationary regime or start overfitting

4. Which architecture is most "reliable" (decent generalization performance for most hyperparameter+ optimizer settings), and which is more unstable across settings? I would use GRU because it is a more robust architecture and it gets the better result. Transformer is a fancy architecture but it was the only architecture that was unstable during the experiments

5. Describe a question you are curious about and what experiment(s) (i.e. what architecture/ optimizer/hyperparameters) you would run to investigate that question.

Figure 39: text

## 5 Problem 5: Detailed evaluation of trained models

1. We compute the average loss for all the validation sequences at each time step. The main script has been modified to load a pre-trained model and process the validation model while computing the loss at each time step individually (This is indicated in the script `ptb-lm-P5-1.py` under "Loss computation", Line 405). The resulting curves for the three models are shown in Figure 39.

The loss is clearly larger when the training starts as the model does not have much information about the sequence at hand and cannot predict accurately. As we proceed, all the models should start making better predictions and thus the reduction of the loss. Although the loss fluctuates, it seems to be stabilizing around certain values, of which the RNN loss shows a higher loss while the GRU and Transformer perform similarly to each other but better than RNN.

2. Similarly to point 1 above, we modified the main script (see `ptb-lm-P5-2.py` under LOSS COMPUTATION on line 405). Here instead of processing the whole sequence at each step, we only run one mini-batch, processing each time step separately without touching the hidden states. This allows us to compute the gradient at time  $T$  with respect to the hidden state at each time step  $t$ .

We compute the norm of the concatenated gradient vectors for the different layers and plot them with respect to the time steps as illustrated in Figure 40. Note that the values for each curve are rescaled to be in the range  $[0, 1]$ . This way we can compare the behavior of the gradients of the two different models (RNN and GRU). The graph shows how the gradients with respect to earlier time-steps are smaller than the gradients with respect to later times. This indicates that long-term dependencies contribute less to the gradient at a

Figure 40: text

given point. The drop in the dependency is particularly steep on the RNN model. On the other hand, the mechanics of GRU help better maintaining the long-term dependencies.

3. We generate samples from both the simple RNN and GRU. We use the models from section 4.1. The sampling code can be found in the script `generate.py`. We produce 20 samples from RNN and GRU, 10 samples of the same length as the training sequences (35) and 10 samples that are twice the length of the training sequences (70). The samples can be found in the Appendix of the report. We choose three best
